1.0 Introduction

- The existing LC & VRF DX Interfaces use TA set-point control (via Remote Controller) to maintain Room Air (or Return Air) temperature. In response to Customer requests we have developed a new DX interface with can directly control capacity, operation and mode from a BMS system
- The new LC / VRF 0-10V DX Interface enables BMS capacity control of Toshiba Outdoor units connected to a DX Coil (within an AHU). It is compatible with either a Toshiba LC system (DI /SDI / DI-Big) or a Toshiba VRF system (SMMS-i)
- Following additional development the TA sensor is still used on the 0~10V AHU DX Interface for improved capacity control by increasing the capacity range of the system. The effect of this is improved customer comfort and reduced system running costs
- The interface includes a common DX Controller (RBC-DXC031) for both LC & VRF systems. As default this is configured as a LC model (changed by DIP-SW for use with a VRF system).

1.1 Introduction

- The VRF 0-10V DX Interface is only compatible with SMMS-i 8 & 10HP outdoor units.
- Additionally for VRF systems an appropriately sized VRF DX PMV must be brazed to the DX Coil used in conjunction with the DX Controller.
- For LC systems the DX Controller is connected directly to the outdoor unit (no VRF DX PMV required).
- The Toshiba system must be connected 1:1 with a DX-Coil (up to 10HP).
- DX Coil's larger than 10HP need to be split into separate sections each with dedicated circuits (Distributors and Headers)
- Product Availability: Q2 2015
- *The existing TA control models will continue to be sold:-*

2.1 New LC / VRF 0-10V AHU DX Interface

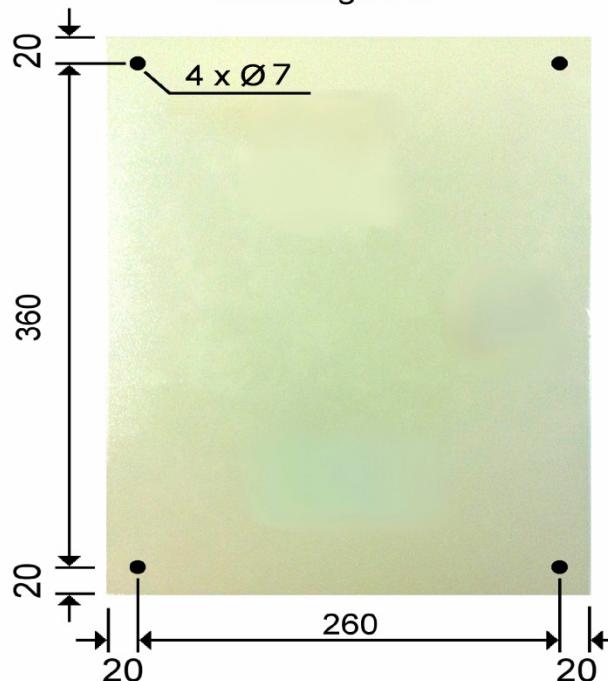

- **DX COIL Interface (RBC-DXC031)**

The DX Coil Interface **MUST NOT** be installed outside. To maintain waterproof integrity IP65 glands must be used through the gland plate (To avoid damage; when making holes for cables glands, please first remove the Gland Plate from the DX Coil Controller).

2.6 New LC / VRF 0-10V AHU DX Interface

LC / VRF Configuration

- The interface includes a common DX Controller (RBC-DXC031) for both LC & VRF systems
- As default this is configured as a LC model (changed by DIP-SW501 on MCC-1570 for use with a VRF system)

2.7 New LC / VRF 0-10V AHU DX Interface

Device Type / Capacity DN Code setting (Requires wired Remote Controller)

- The interface uses a new Device Type DN Code 10_55. This is set at the factory.
- The installer must be set DN Code 11. As default this is configured as a 10HP model at the factory (23).

2.8 New LC / VRF 0-10V AHU DX Interface

CN60 – Output Functionality for AHU Application

- New output functions are available from the CN60 connector on the MCC-1570 PCB in the DX interface
- For ease of installation connection to the CN60 outputs are made on the relays included in the DX interface

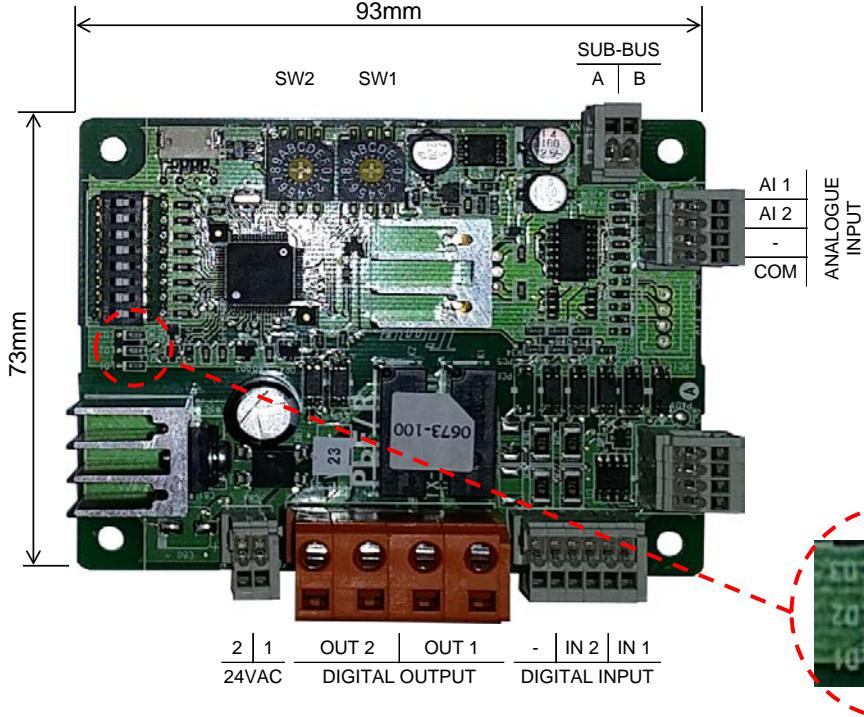

CN60 Output	Output Function	DX IF Relay Number
CN60.1+2	Defrost output	KP4
CN60.1+3	Cooling / Heating start up control	KP5
CN60.1+4	Pre-defrost output (static or pulse*)	KP6
CN60.1+5	Cooling / Heating mode	KP7
CN60.1+6	Fan operation	KP2
